

Eliminate Side Stitches With...

SIDE STITCH EXERCISES

Just as we strength train our hips or hamstrings to reduce injuries, we can strengthen the muscles used for breathing to help reduce the chance of side stitches.

Side stitches are likely caused by stretching the ligaments that extend from the diaphragm to the liver. When a runner or walker pounds the surface while breathing in and out, he or she stretches these ligaments, and that causes the pain.

One of the most effective methods for strengthening your diaphragm is using pilates. Pilates help stretch your intercostal muscles and lengthen the spine, which helps improve breathing and reduces the occurrence of side stitches.

THE HUNDRED

Lie on your back, knees bent, feet flat on the floor. Keep your arms at your sides, palms down. Inhale and lift your head, neck, shoulders, and arms off the ground. Lift your knees and extend your feet so your legs are straight and at a 45-degree angle to the floor. Take five short breaths in and five short breaths out. While doing so, pump your arms, moving them in a controlled up and down manner. Do a cycle of 10 full breaths—each breath includes five inhales and five exhales. After you do 10 complete breaths, you will have completed 100 arm pumps.

The Payoff: Teaches controlled breathing, so that your inhales and exhales are balanced. Bonus:

Builds strong abdominals.

THE SWAN

Lie face down with your palms flat under your shoulders (as if you were going to do a pushup). Look down so your neck is in line with your spine. Inhale and slowly lift your head, neck, shoulders, and chest as you press your hands into the ground. Keep a slight bend in your elbows. As you exhale, slowly lower yourself back down, chest first, then shoulders, neck, chin, and head. To avoid discomfort in your back, concentrate on pulling your shoulders back to open up your chest. Repeat 10 times.

The Payoff: Opens up the chest and deepens your lung capacity to correct shallow breathing.

CHEST EXPANSION

Stand up straight with your feet shoulder-width apart, your knees slightly bent, and your arms at your sides. Inhale and sweep your arms out and up so that your biceps are near your ears and your palms are facing each other. Exhale and lower your arms back down to your sides. Repeat four times, concentrating on breathing deep and opening your chest.

The Payoff: Stretches the intercostal muscles (which lie between the ribs), relaxes the shoulders, engages the diaphragm and pelvic floor, and helps balance breathing between the left and right lungs.

WHEN TO PERFORM

If you suffer from regular, recurring side-stitches, include these exercises before every run. You can perform the second two stretches if you get a side stitch mid-run. Yes, you'll have to stop, but getting it fixed is better than running in pain.
